MICROFILMED

Terrain and Climate at the Southern
Shore of the Caspian Sea

The narrow, flat plain that lies between the Caspian Sea and the foothills of the Elburz Mountains varies in width from approximately 20 miles near Behshahr (30°43'N 53°34'E) to less than 5 miles near Bandar-e Gaz (35°47'N 53°59'E). Within a few miles of the coast, elevations range from approximately 80 feet below sea level on the plain to several hundred feet above sea level in the Elburz foothills. (The surface of the Caspian Sea is approximately 20 feet below sea level.) The nearby Elburz Mountains rise to 5000 feet above sea level within 10 to 20 miles of the Caspian and to more than 10,000 feet 25 to 30 miles south of the coast.

A shallow bay, the Khalij-e Gorgan, borders the plain on the northeast. The bay, approximately 25 miles long and six miles wide, is nearly enclosed by the Lian Kaleb Peninsula, a sandbar about one mile wide and 20 miles long. The peninsula has an elevation of approximately 10 feet above the level of the Caspian and consists mainly of sand dunes covered with scrub and reeds; it is believed to be uncultivated and uninhabited. The level of the Caspian has dropped about 8 feet since 1929 and the Khalij-e Gorgan is gradually being filled in by surrounding marshes.

The plain is crossed by several large, steep-sided perennial streams and numerous smaller ones. The Roka Rudkhaneh-ye, the largest river in the study area, flows westward until it reaches the village of Roka where the river turns northward to enter the sea. The smaller streams which cross the plain and enter Khalij-e Gorgan from the south are all less than 10 miles long.

The Caspian plain is one of the country's main agricultural areas; paddy rice is the dominant crop but some barley, cotton, and possibly wheat are raised on the higher ground. Deciduous and citrus fruit orchards and winter and early spring vegetable gardens are located near the settlements. In the uncultivated areas the natural vegetation consists of shrubs and grasses with trees along the water courses. The foothills and the northern Elburz slopes have

CONFIDENTIAL

19

CONFIDENTIAL

large forests of mixed hardwoods with some stands of beeches and oaks. These forests are generally at and above the 1000 foot contour level.

This portion of the plain is included in the Mazandaran Ostan or province which has its capital at Sari. According to the 1966 census, the ostan has a population density of approximately 100 people per square mile. Approximately 75 percent of the ostan's population is rural. Most of the people live in the numerous small villages that lie in the plain and along the base of the foothills.

The only asphalted road in the area crosses the plain along the base of the foothills linking Gorgan, Bandar Shah, Behshahr, Sari, and other towns to Teheran. Scattered rural settlements are connected by a sparse network of earth or gravel roads. Most maps show an unimproved track running along the coast from Babol Sar to the eastern tip of the Mian Kalch Peninsula, but its present condition is not known: it is probably passable in dry weather. A railroad line (4' 8 1/2" standard gauge) runs from Teheran across the plain to Gorgan. This is a branch of a main line that connects Teheran to Meshed.

Cross-country movement generally would be easy on the plain except in some cultivated areas, where shallow irrigation ditches restrict movement. Streams are flooded occasionally during March and April, when waters from melting snow and the rainy season combine, and during the heavier rains of October and November, but are shallow and fordable most of the remainder of the year.

The Caspian plain has cloudy, wet winters and hot, steamy summers and high relative humidity throughout the year. Summer temperatures rise to the 80's and 90's during the day and drop to the 70's at night; the winters are mild with daily highs in the 50's and lows in the 40's. Summer temperatures in combination with high relative humidities are very oppressive. The area receives approximately 30 inches of annual rainfall, most of which falls from October through March. Showery, cloudy periods occur in the summer however, and at least 1 inch of rainfall can be expected every month in the year. Snowfall is rare. Dew is heavy from March to September. Along the coast, it is generally calm in the mornings but in the evenings light onshore breezes develop. (See Appendix A, Tables 1 through 4 for detailed climatic data.)

CONFIDENTIAL

Baku, USSR (40°23'N 49°41'E) is an important petroleum industry center. The city spreads around the shores of a horseshoe-shaped bay on the southern coast of the Apsheron Peninsula. Away from the shore, the slopes of a low-lying plateau create a natural amphitheater surrounding the bay on three sides. The plateau forms the backbone of the Apsheron Peninsula, an eastward extension of the Greater Caucasus, the massive mountain range which has given its name to the region.

Baku has a dry, moderate climate. Precipitation is about 8 inches per year with most falling in the colder months. In the summer the temperatures are in the 80's during the day and in the 70's at night; winters are cold with highs in the 40's and lows in the 30's. Evaporation rates greatly exceed the scanty rainfall. During the summer hot, dry winds from the north and northwest sweep around the eastern end of the Greater Caucasus mountain range, and carry dust across the city from the steppes to the north. The slopes of the Apsheron Peninsula are treeless and barren. There is little greenery, although the municipal authorities permit diversion of some water to sustain trees and shrubbery in parks and along avenues. The gardens, orchards, and vineyards surrounding the city are irrigated from deep wells. The nearest forested area is more than 40 miles to the northwest on the slopes of the Greater Caucasus. (See Appendix B, Tables 5 through 8 for detailed climatic data.)

Copies of the following maps are enclosed with this report:

- 3 sheets of the U.S. Army Map Service's topographic series K502 at 1:250,000, dated 1961. (2 copies each)
- 1 sheet of the ACIC's ONC series at 1:1,000,000, dated 1968. (1 copy)
- 1 sheet of Bartholomew's Middle East at 1:4,000,000, dated 1970. (1 copy)
- 6 sheets of the Iranian National Cartographic Centre's Forestry series at 1:50,000, dated 1968. (1 copy each)
